

Tree Based Regressions

Decision Trees & Random Forest Regression

However, we don't know the optimal dosage to give to patients.

VS.

So we do a clinical trial with
different dosages...

...and measure how effective
each dosage is.

If the data looked like this...

...and, in general, the higher the dose,

...and, in general, the higher the dose,
the more effective the drug...

...we could use the line to predict that a **27 mg Dose** should be **62% Effective**.

However, what if the data
looked like this?

In this case, fitting a straight line to the data will not be very useful.

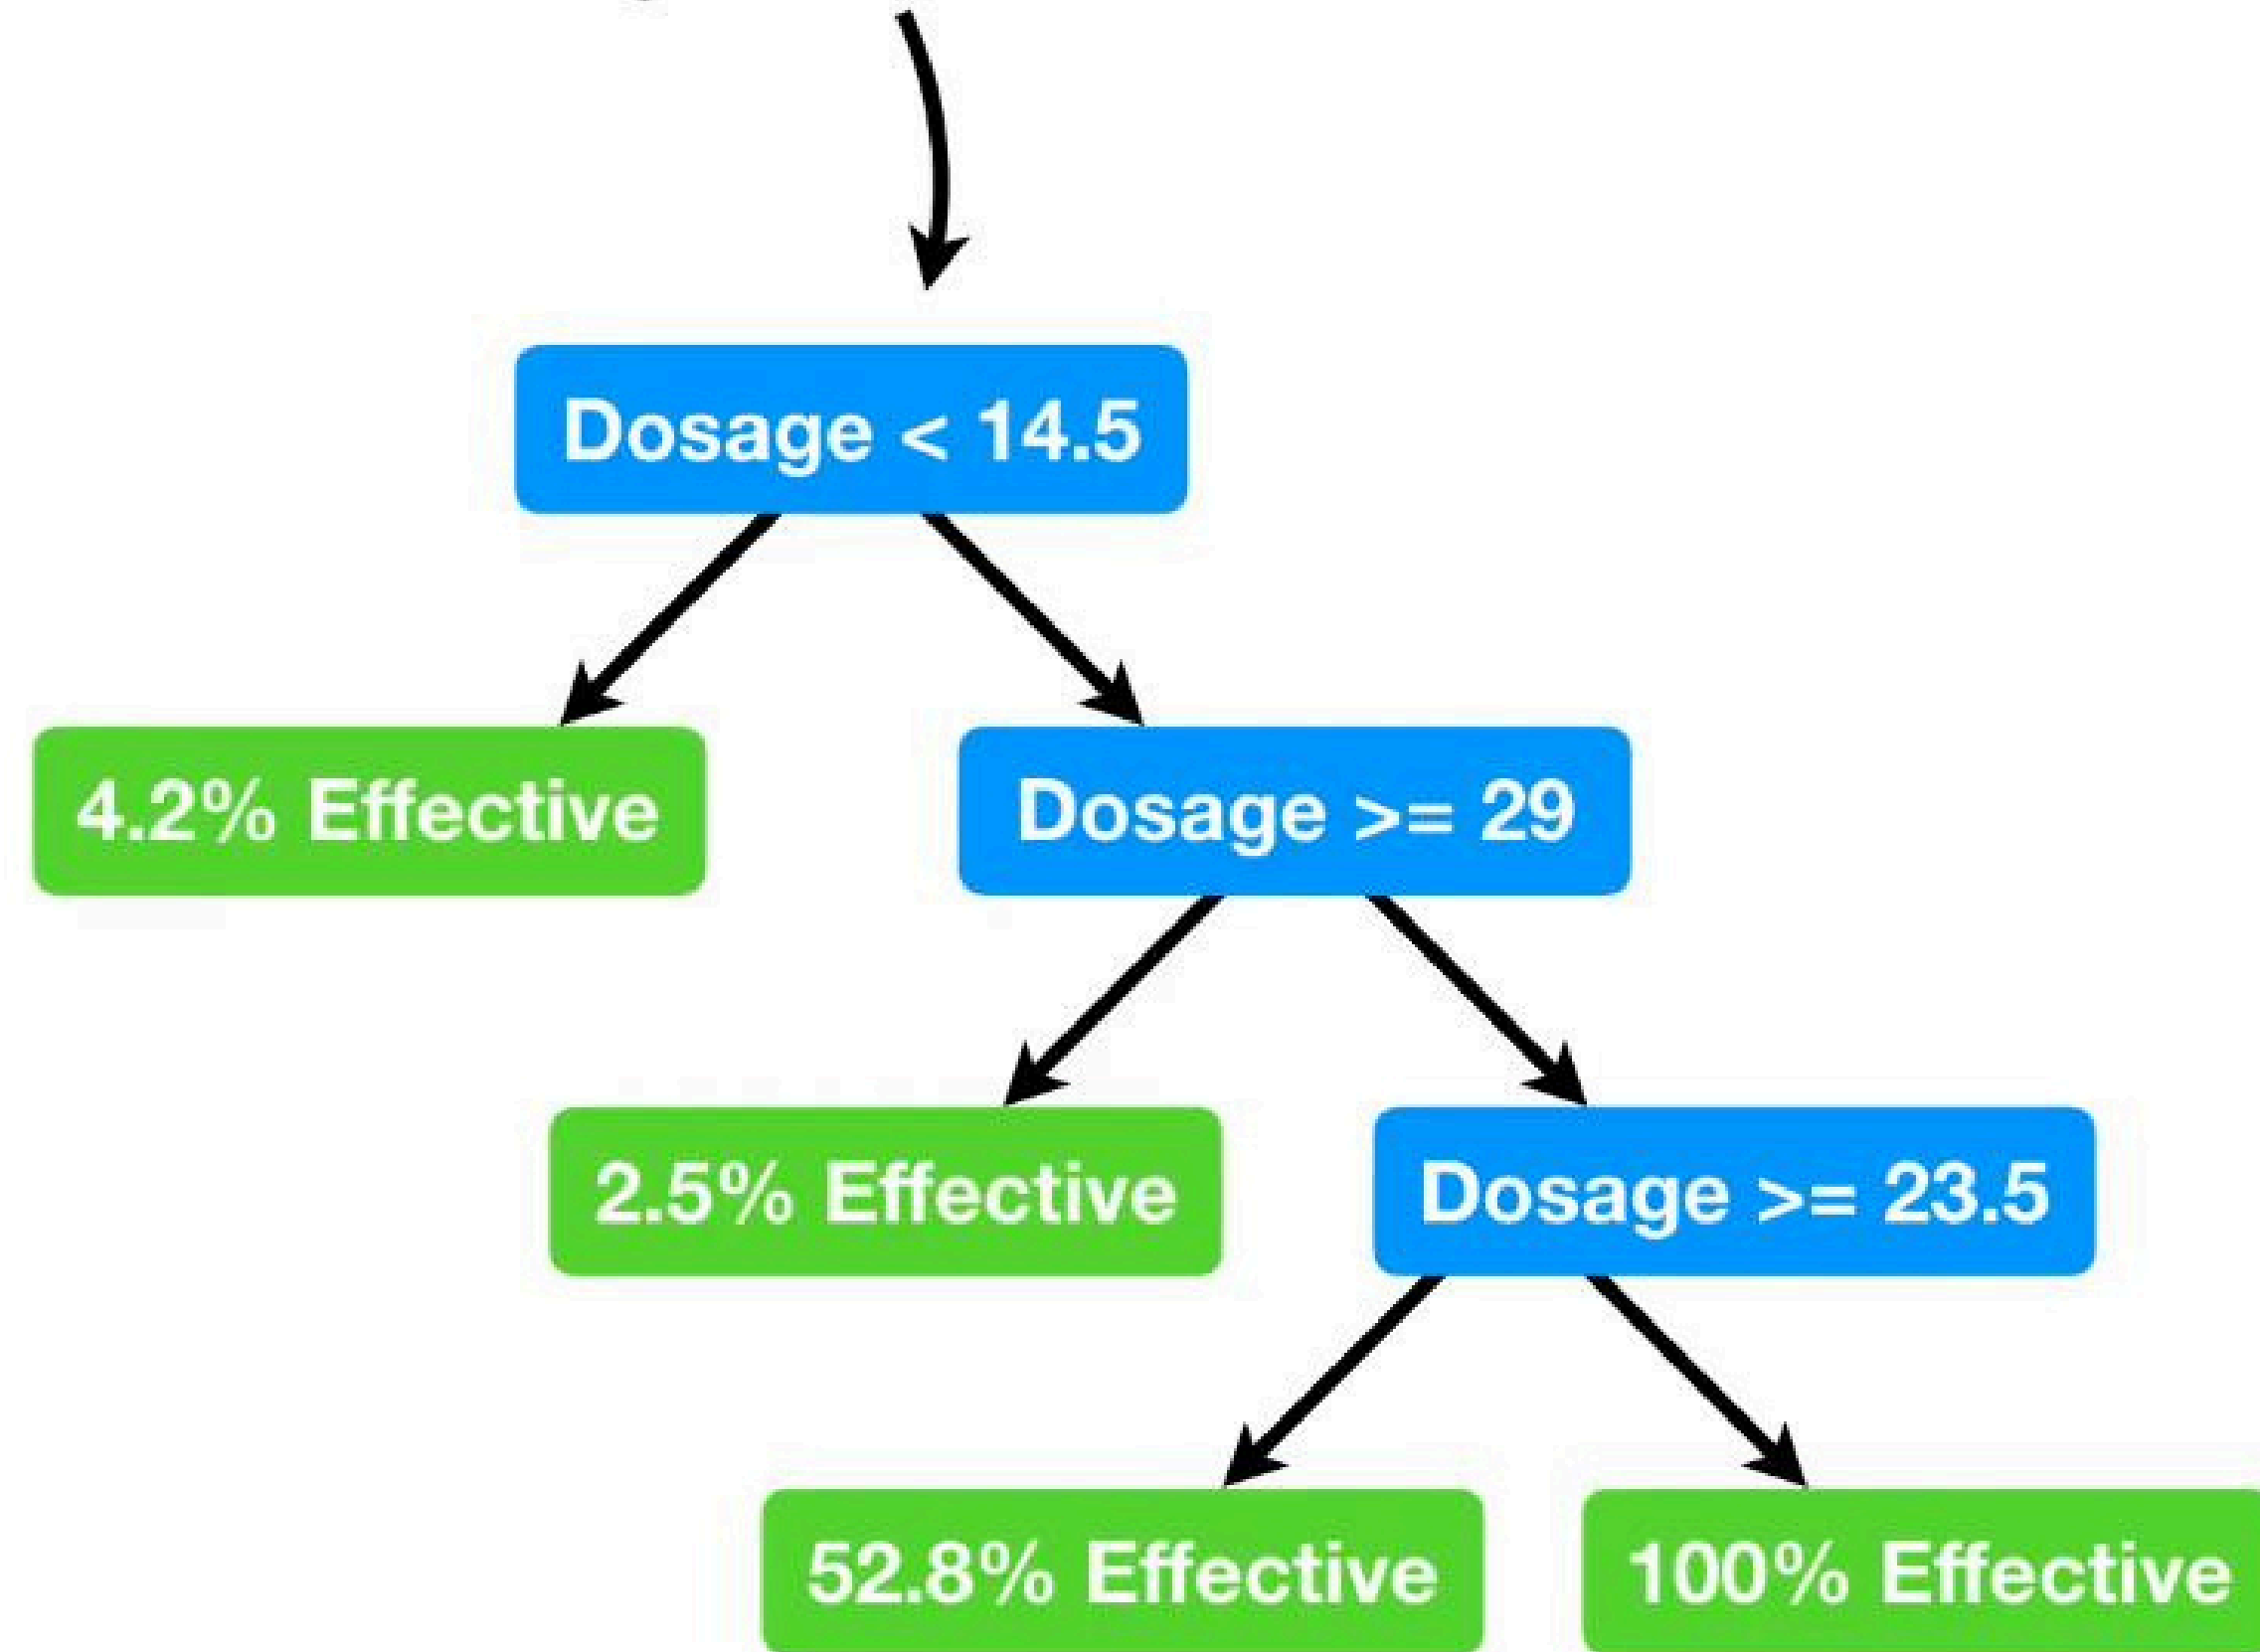

...then we would predict that a **20 mg Dose** should be **45% Effective**...

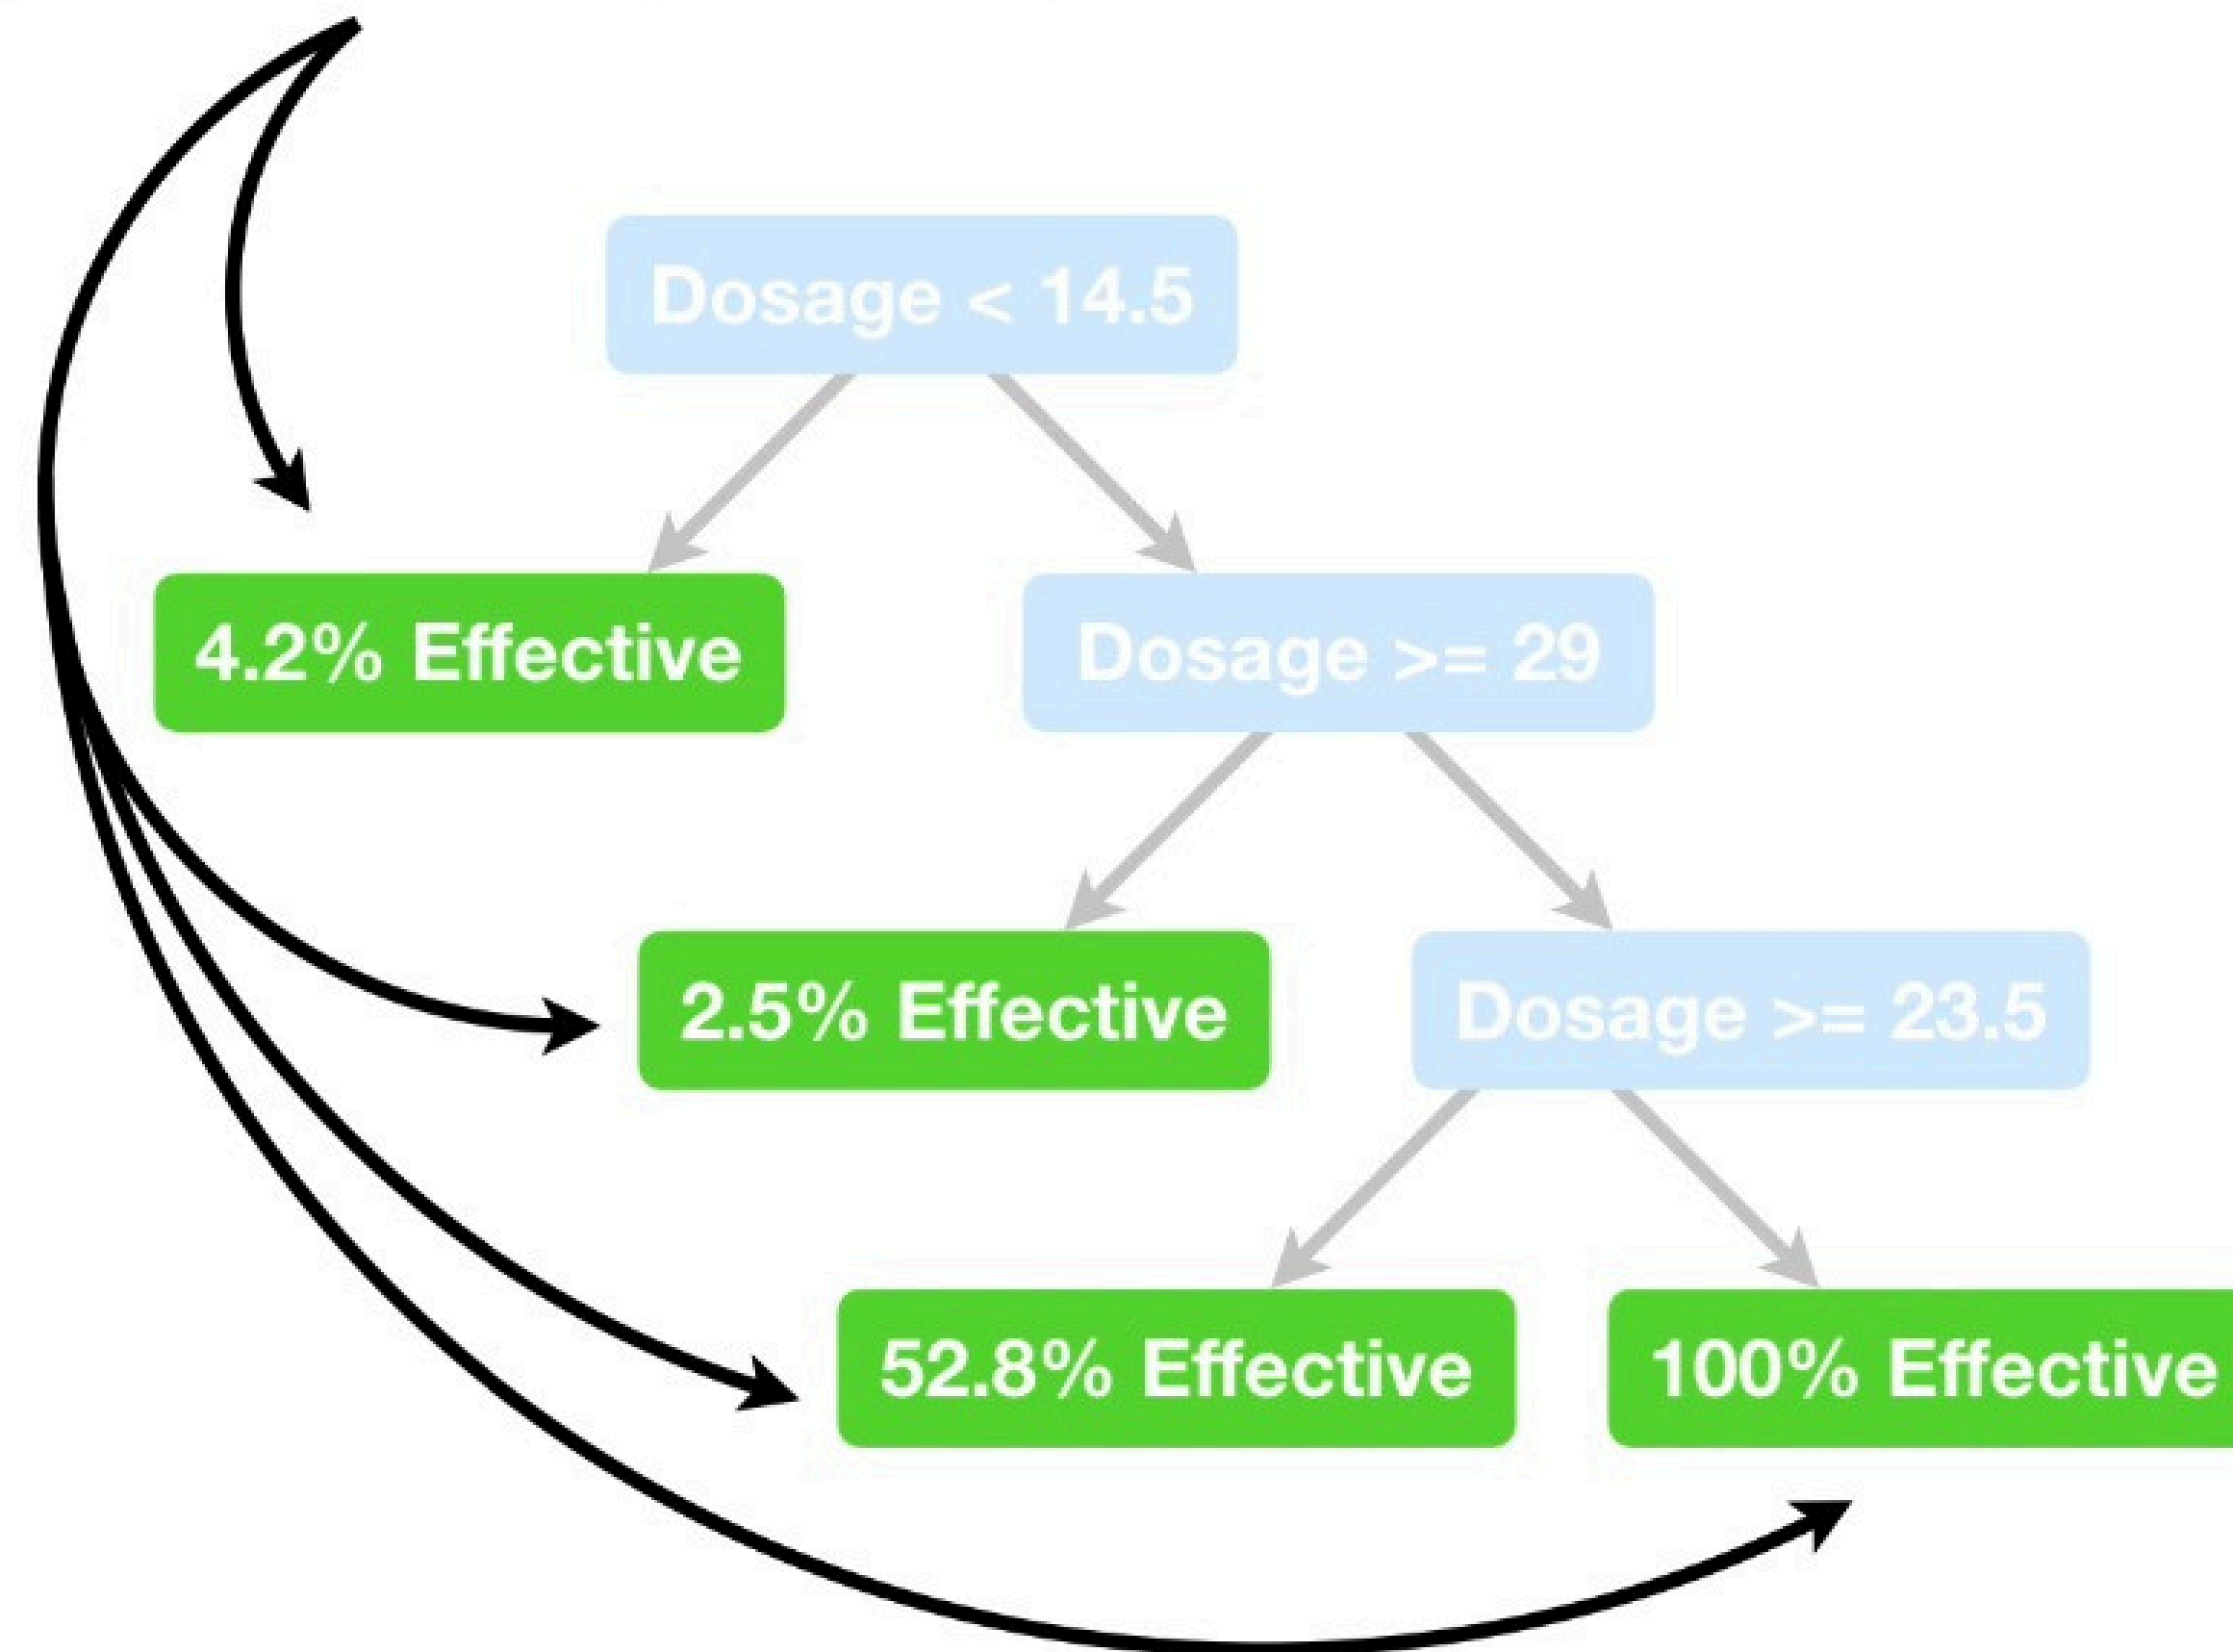

...even though the observed data
says that it should be **100%**
Effective.

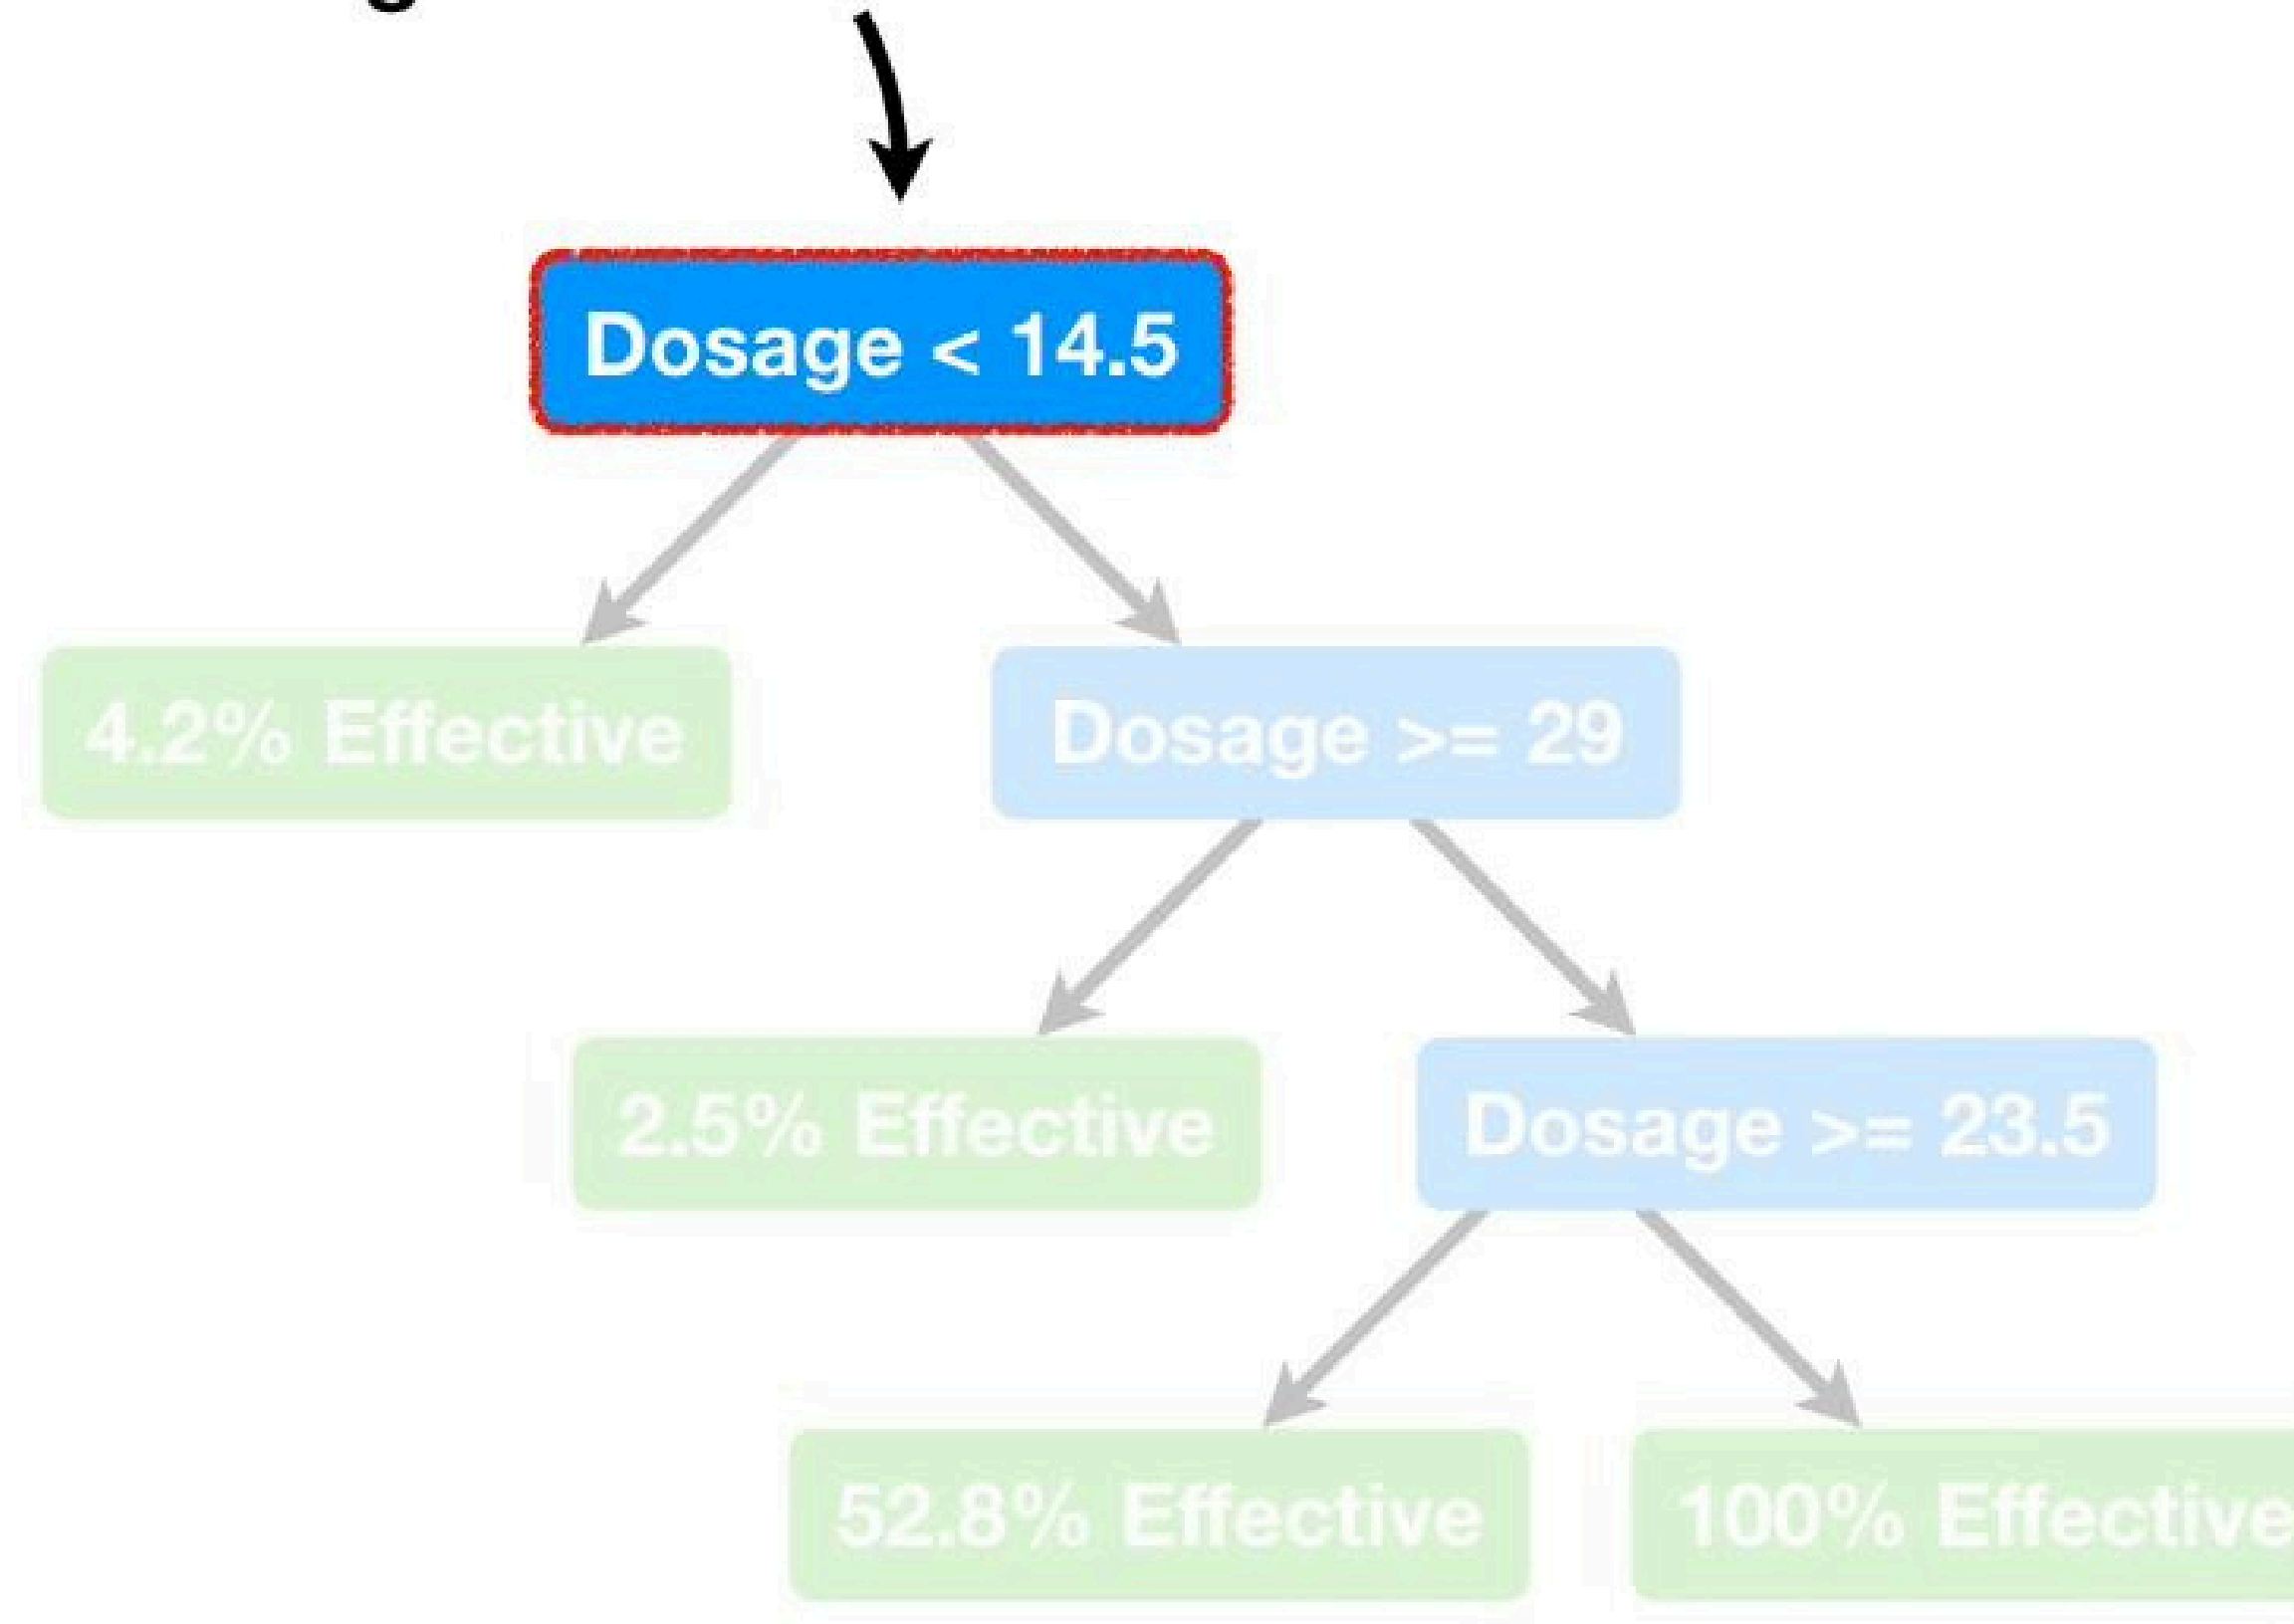

One option is to use a **Regression Tree**.

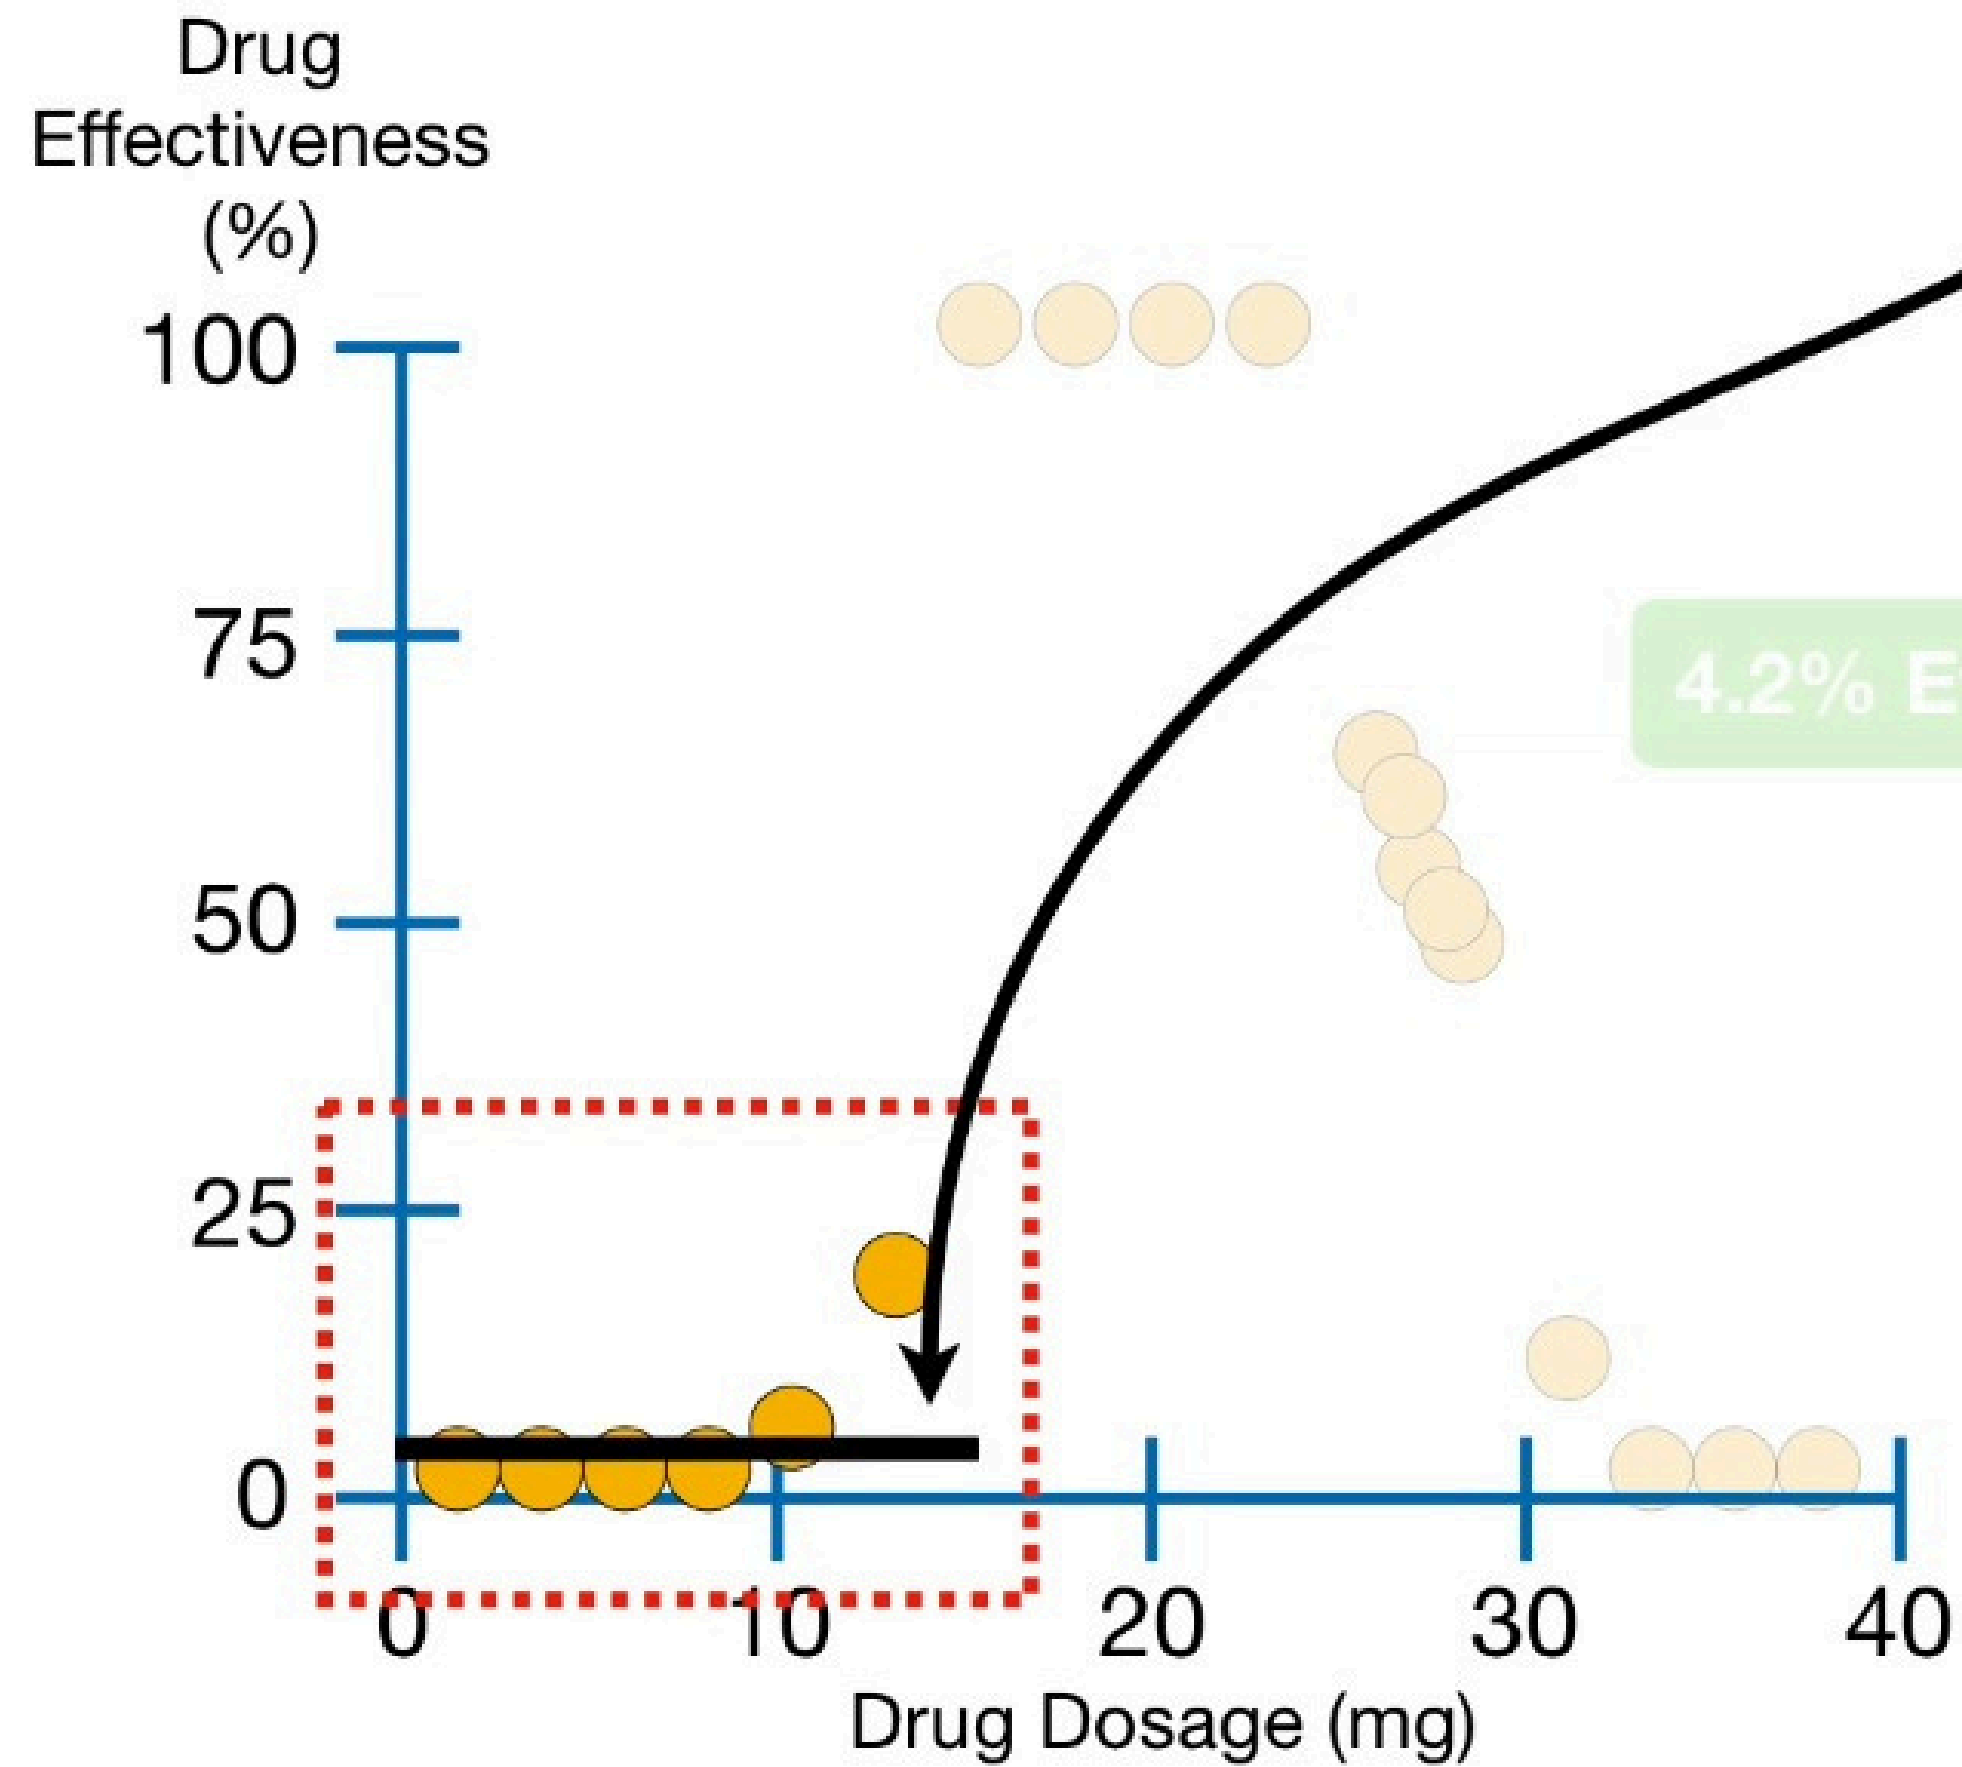

In a **Regression Tree**, each leaf represents a numeric value.

With *this* **Regression Tree**, we start by asking if the **Dosage** is less than **14.5**.

...and the average **Drug Effectiveness** for these **6** observations is **4.2%**...

Dosage < 14.5

4.2% Effective

Dosage >= 29

2.5% Effective

Dosage >= 23.5

52.8% Effective

100% Effective

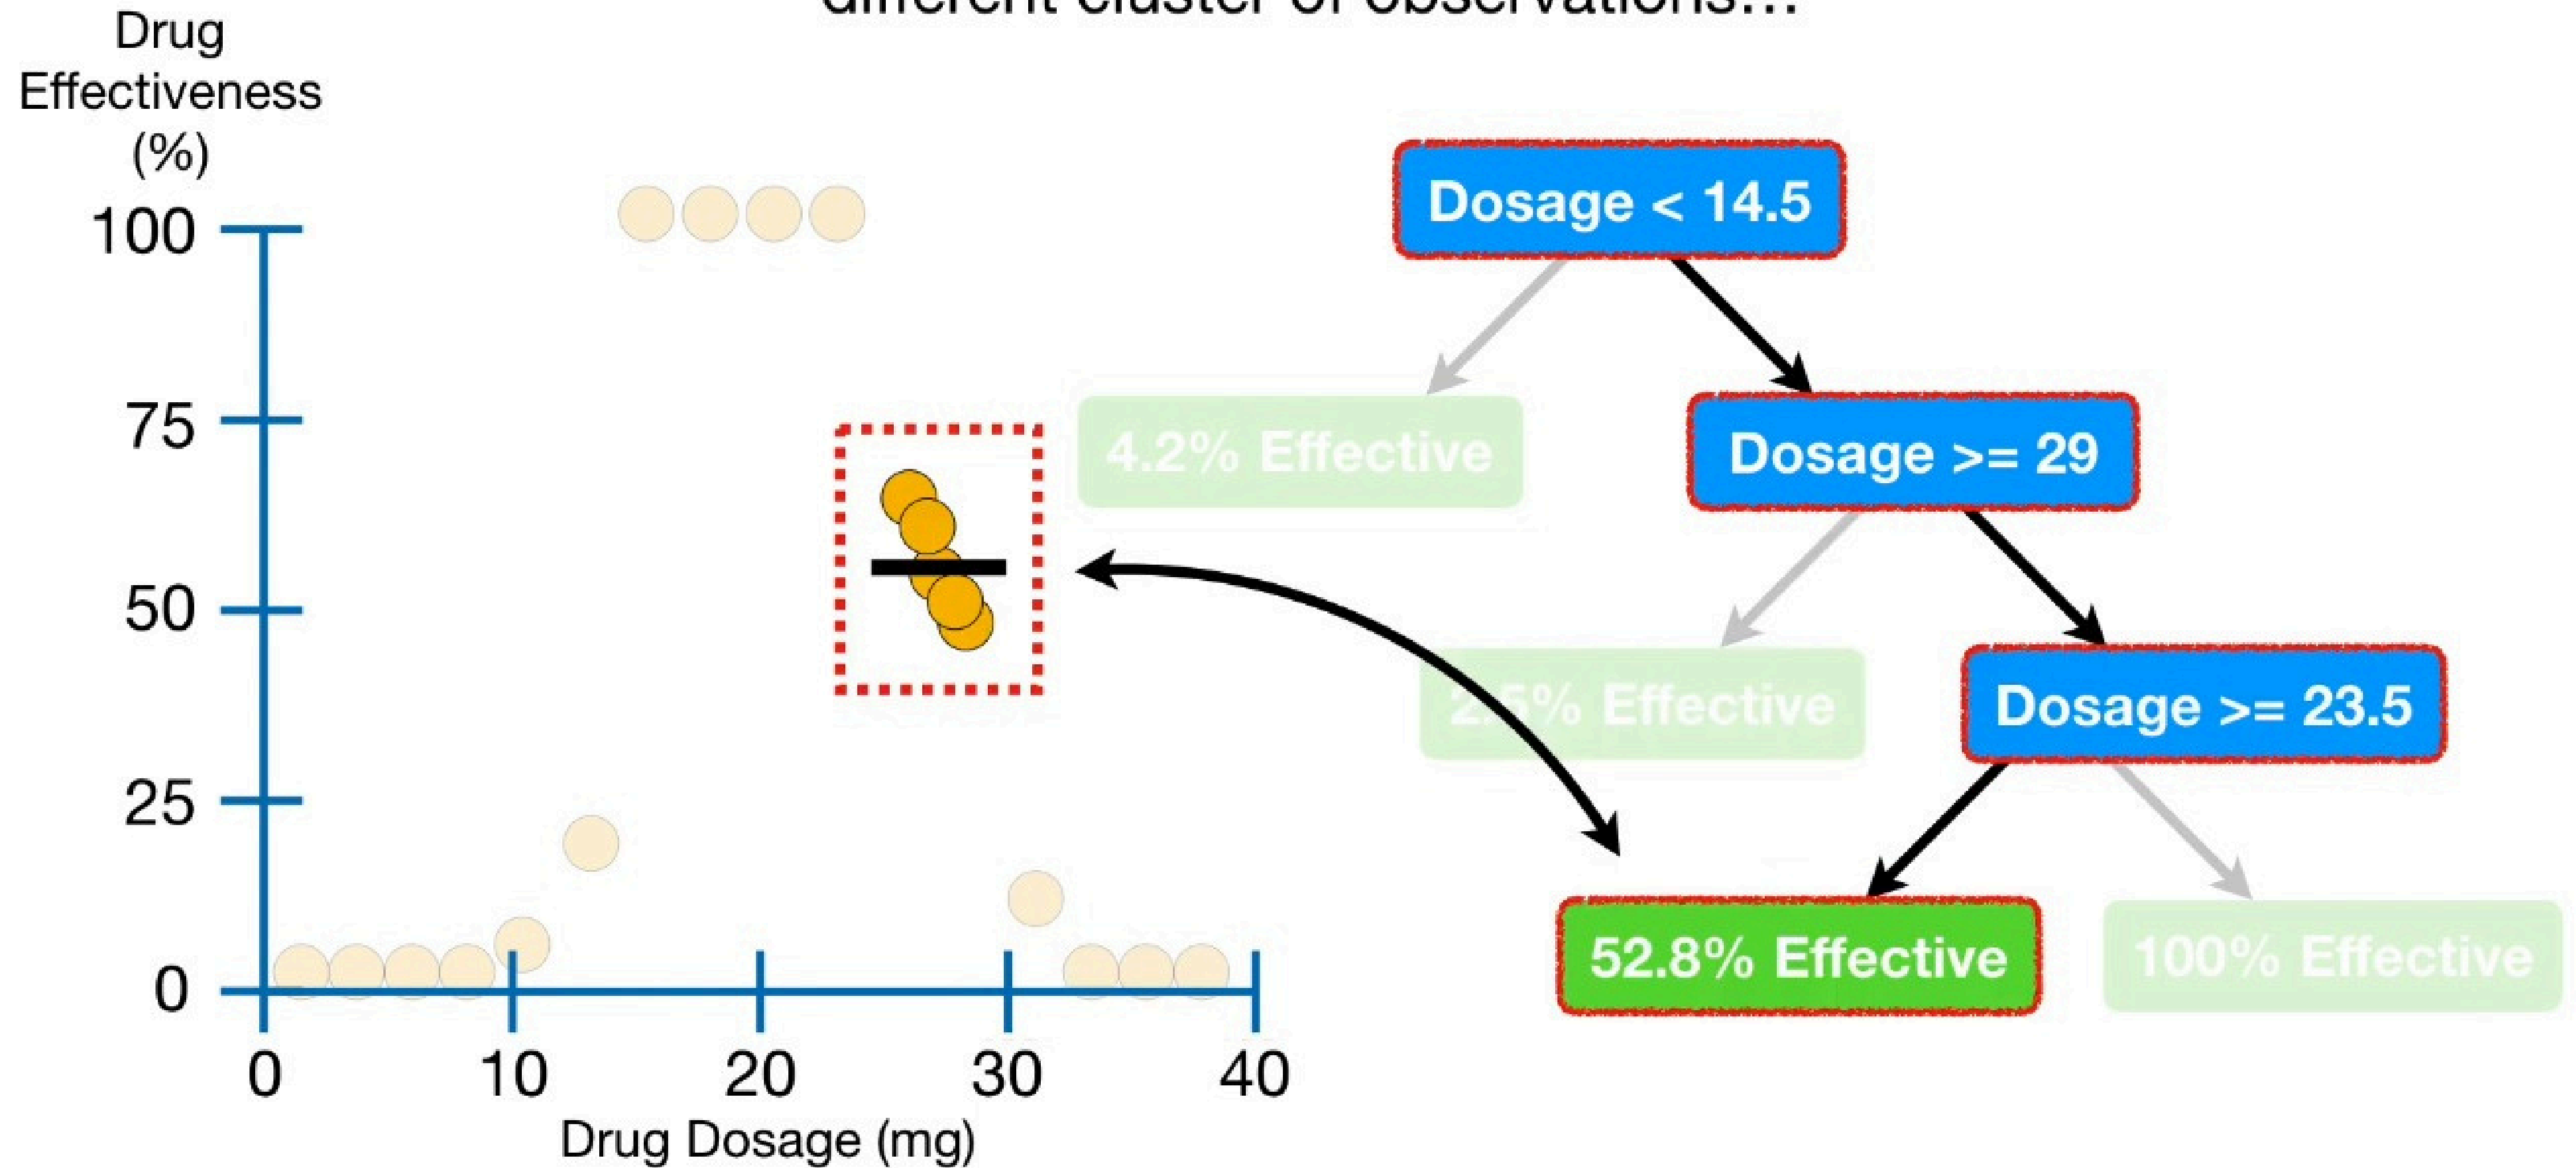

...so the tree uses the average value,
52.8%, as its prediction for people with
Dosages between **23.5** and **29**.

...so the tree uses the average value,
100%, as its prediction for people with
Dosages between **14.5** and **23.5**.

Since each leaf corresponds to the average **Drug Effectiveness** in a different cluster of observations...

At this point you might be thinking, “The **Regression Tree** is cool, but I can also predict **Drug Effectiveness** just by looking at the graph...”

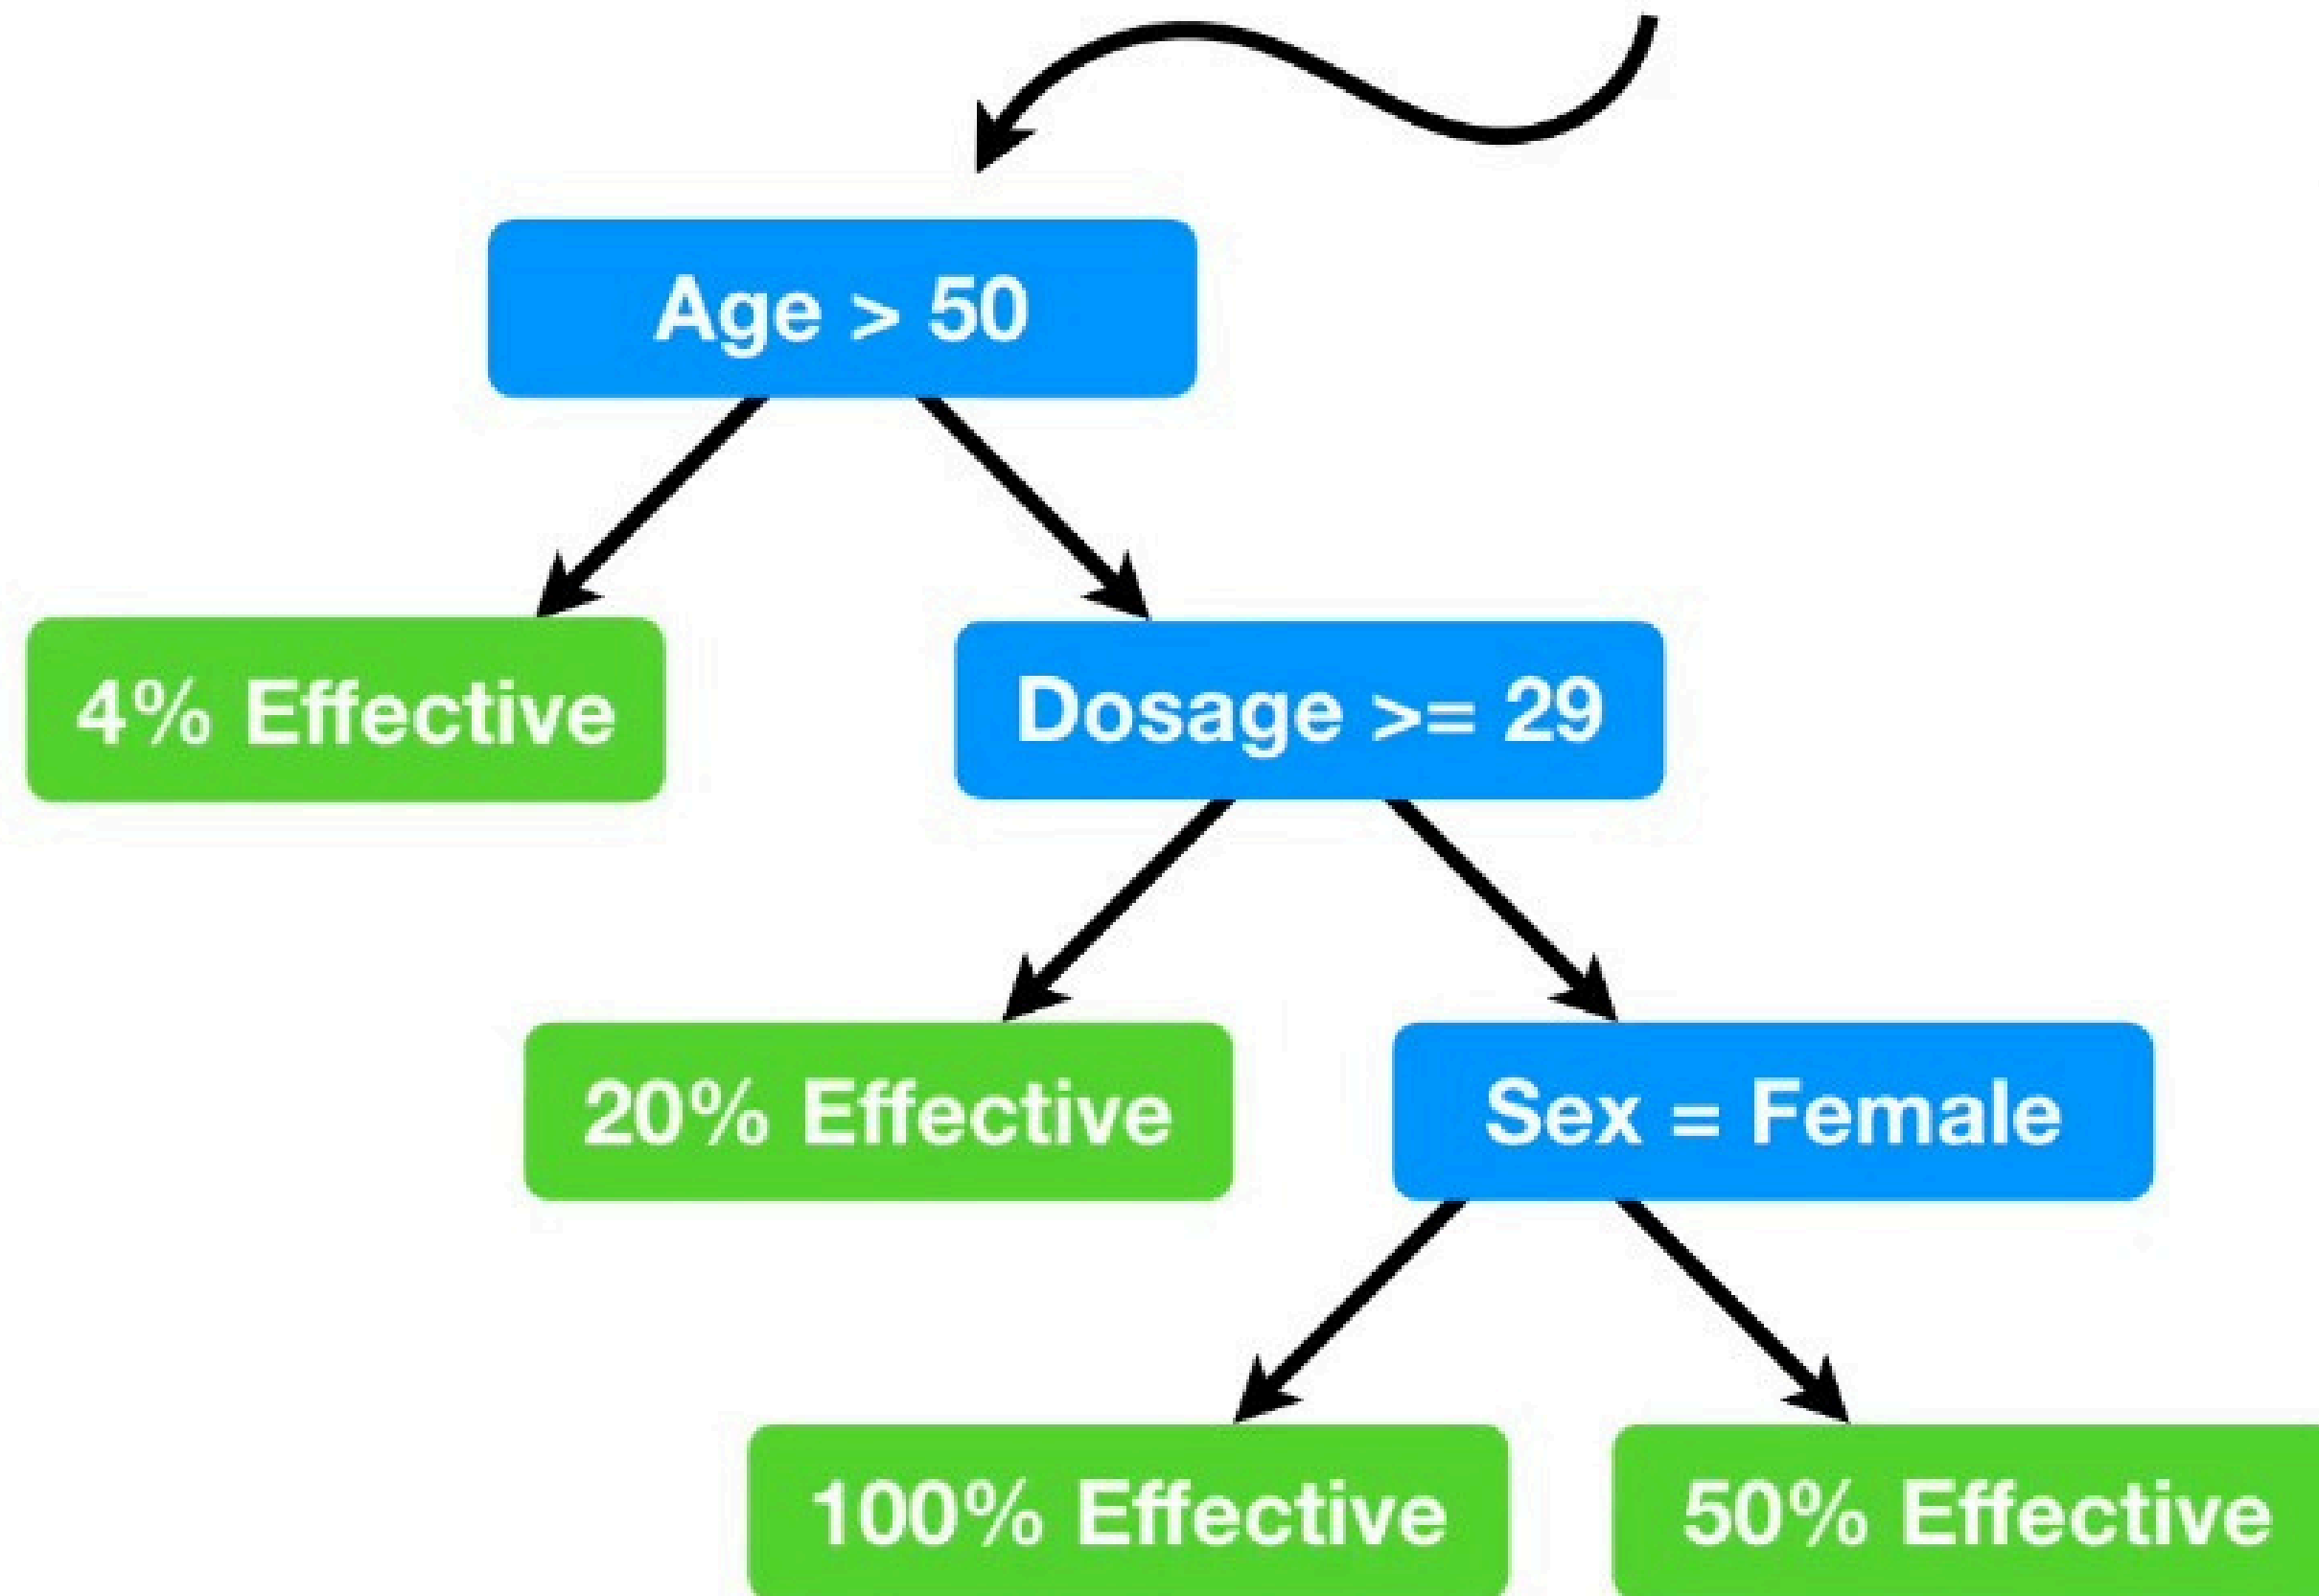

But when we have **3** or more predictors, like **Dosage**, **Age** and **Sex**, to predict **Drug Effectiveness**, drawing a graph is very difficult, if not impossible.

Dosage	Age	Sex	Etc.	Drug Effect.
10	25	Female	...	98
20	73	Male	...	0
35	54	Female	...	100
5	12	Male	...	44
etc...	etc...	etc...	etc...	etc...

In contrast, a **Regression Tree** easily accommodates the additional predictors.

Dosage	Age	Sex	Etc.	Drug Effect.
10	25	Female	...	98
20	73	Male	...	0
35	54	Female	...	100
5	12	Male	...	44
etc...	etc...	etc...	etc...	etc...

Now you fully understand
the concept

Decision Trees

Random Forest
